Turbulent combustion 595
Turbulent dispersion 133
Two phase flow 133
Two-way coupling 133

Vaporisation 133
Volatilization 275

SUBJECT INDEX

Absorption cross sections 234–236
Absorption spectroscopy 239–246
Additives, GDI engine 512
Advanced Turbine Systems (ATS) program 354
Agriculture, sewage sludge 62–63, 65
Aharonov–Bohm effect, Newton's third law 182–185
Algebraic stress model (ASM), turbulence modelling 136
Allan's experiment 192
AlliedSignal high-pressure swirl injector 457
Ampère force law 162, 193
Anisotropy
  blackbody radiation 192
  particles 27
Anomalous diffraction 19
Antenna radiation, Newton's third law 185–187
Asbestos 37
Ash
  see also Fly ash
  sewage sludge 95, 96, 102
Ash deposition
  accumulation model 124
  arrival rate 120–121
  flow dynamics 119
  particles 119–120
  pulverized coal-fired applications 117–132
  sticking efficiency 121–123
  test results 129–130
  test rig 124–128
ASM *see* Algebraic stress model
Atoms, absorption cross sections 234–236
ATS *see* Advanced Turbine Systems
Audi 545
Automotive spark-ignited direct-injection gasoline engines 437–562

Ball lightning 198
BBO (Basset, Boussinesq and Oseen) equation 137
Beam shapes 7–11
Biot–Savart force law 193, 194
Black liquor (BL) 275–304
  aggregate combustion 286–287
  char combustion 285, 299
  combustion of single drops (experimental) 281–283
  combustion of single drops (modeling) 283–286, 299
  controlled formation 288–290
  devolatilization 279, 284–285, 299
  drying 279, 284
  entrainment of pyrolized particles 298, 302
  flow reactor studies 287–298
  in-flight mass losses 299–302
  in-flight processes 278–280
  in-flight study 290–298, 299
  kraft cycle 276–277
  single-particle reactor 283
  spray formation 281
  thermophysical properties 280–281
Blackbody radiation 192
Blow-by 263
Born approximation 16–17
Boundary conditions, scattering theory 7–13
Brake-specific fuel consumption (BSFC) 440, 483, 514, 522
Brickworks, sewage sludge co-combustion 70–76, 104–106
BSFC *see* Brake-specific fuel consumption
Bulk flame quenching 569

CAFE *see* Corporate average fuel economy
Carson reciprocity theorem 179–182
Carver–Greenfield (C–G) process 79
Cavity ringdown absorption spectroscopy (CRDS) 242–246
CCSEM *see* Computer control scanning electron microscopy
Cement kilns, sewage sludge co-combustion 76
CFD *see* Computational fluid dynamics
CH radicals, LIF 247
Char combustion, sewage sludge 91–93
Char oxidation 408–409
Chemical percolation devolatilization (CPD) model 406
CIDI *see* Compression–ignition, direct injection
CINAR (CFD combustion code) 119
Circuit theory, Newton's third law 183–185
Classical mechanics
  covariance principle 167–168
  Newton's third law 162–166
  relativity principle 166–167
Clay brick manufacture, sewage sludge co-combustion 75–76, 85
Clean Air Act Amendments (1990) 344
Closed-coupled main catalyst, HC emissions 585–586
CMC *see* Conditional moment closure
CO emissions, LPC 354
Co-combustion technologies, sewage sludge 70–76, 104–106
Coal
  char oxidation 408–409
  devolatilization 405–408
  fly-ash discrimination 37
  slagging 118, 130
Coal ash deposition *see* Ash deposition
Coal combustion, sewage sludge 88–91, 99–103
Coal-fired power plants, sewage sludge co-combustion 71
Cold-start hydrocarbon emissions
  after-treatment systems 585–590
  cycle-by-cycle analysis 574–584
  engine design 584–585
  port-injected gasoline engines 563–593
  reduction 584–590
  sources 568–574
  system optimization 590–591
Collision, relativistic 170–171
Combustion chamber geometry, GDI engine 470–494
Combustion efficiency 308–311
Compound vortex combustion chamber engine (CVCC) 532
Comprehensive combustion models 387–436
  data availability 416–417
  data requirements 413–416
  evaluation 413–420
  features 392–413
  particle reaction submodels 405–409
  predictions 420–429
  reacting flows 403–405
  solution strategies 411–413
  validation 391
Compression–ignition, direct injection (CIDI) diesel engine 440
Computational fluid dynamics (CFD) 119, 391, 430
Computer control scanning electron microscopy (CCSEM) 118
Concentration measurements
  absorption spectroscopy 239–246
  flat flames 246–250
  intermediate species 233–252
  LIF 237–239
Condensing boilers
  gas analysis 323
  scrubber design 305–337
  sulfurous fuels 313–314
  water analysis 323
Conditional expectations 606–608
Conditional moment closure (CMC)
  conservation integrals 628–630, 638–639

decomposition method 620–621
differential diffusion 673–676
enthalpy equation 622
equation 618–634
homogeneous flows 659–665
Lagrangian modeling 683–684
methods 600–603
multiple conditions 676–678
physical basis 624–626
primary closure hypothesis 619–620, 621–622
spray combustion 678–682
stationary laminar flamelet model 630–632
turbulent combustion 595–687
turbulent premixed combustion 362, 682–683
turbulent reactors 653–659
turbulent slender layer flows 634–653
Conditional variance 665–673
Conservation law of energy 161–210
Controlled profile reactor (CPR) 392, 418–419
Cornille's pendulum experiments 199–202
Coronal wind 197–198
Corporate average fuel economy (CAFE) requirements 443
Coulomb law 169
Covariance principle
Newton's third law 167–168
relativistic mechanics 168–170
CPD *see* Chemical percolation devolatilization
CPR *see* Controlled profile reactor
CRDS *see* Cavity ringdown absorption spectroscopy
Crevices
cold-start hydrocarbon emissions 572–573
combustion-chamber 253–273
piston 257–264
Cross-polarization 37
Crossing-trajectory effect (CTE) 140
CTE *see* Crossing-trajectory effect
CVCC *see* Compound vortex combustion chamber engine
Cyclone furnaces, sewage sludge 70

Dependent scattering 22
Devolatilization
see also Pyrolysis
black liquor 279, 284–285
models 405–408
sewage sludge 85–86, 87–88
Dew point 308–311
Dewatering 59–60
Deyo's wire experiments 202–203
DFR *see* Dilution flow reactor
Diesel engines, EGR 524–525
Diffraction 4
Diffusion, standard theory of 139
Diffusion approximation 624
Dilution flow reactor (DFR) 659
Dioxins, sewage sludge 94, 98, 105
Direct numerical simulation (DNS) 135, 365, 394, 660–665
Direct-injection, early research 532–535
Direct-injection, stratified charge (DISC) engine 440, 444–470, 519–521
DISC *see* Direct-injection, stratified charge
DISCO (DISpersion COmputing) 140
Discrete particles
equation of motion 137–138
trajectories 142–143
Discretization equations 394–395
Dispersion, standard theory of 137, 139
Disymmetry, light scattering 28–29
Divided catalytic converters systems, HC emissions 586
DNS *see* Direct numerical simulation
Doppler effects 191
Droplet vaporisation models 144
Drying
black liquor 279, 284
sewage sludge 83–86
Dual burst technique 44
Dumping, sewage sludge 64, 65

EBCM *see* Extended boundary condition method
Eddy dissipation concept (EDC) 360, 361
Effluents, standards 58
EGR *see* Exhaust gas recirculation
Electro-burner, gliding arc reactor 224
Electrodynamics, Newton's third law 192–204
Electromagnetism, Newton's third law 173–177
Electrostatic interference 178–179
Electrostatic preicipitators (ESP) 96
Emissions
see also Hydrocarbon emissions
gliding arc reactor 224–226
NO_x 308, 344, 354, 524–532
particulate 529–532
sewage sludge 96
SO_2 308
Engine-out HC emissions 253–273
Enthalpy, conditional moment closure equation 622
Entrained particles, radiative properties 401–402
ESP *see* Electrostatic preicipitators
Etagenwirbler of Lurgi 69
Ether 175, 192
Exhaust gas recirculation (EGR), GDI 505, 524–526
Exhaust gases, gliding arc reactor 226–227
Extended boundary condition method (EBCM) 11
Extinction efficiency 9

Fast chemistry 359
Fast chemistry limits (FCL) 631
Favre averaging 623
FBC *see* Fluidized bed combustors
FCL *see* Fast chemistry limits
FD-DVC *see* Functional group-depolymerization, vaporization and cross-linking
FDTD *see* Forward difference time domain
Fertilizers, sewage sludge 62–63
FEV charge-motion-controlled GDI 550–551
Fiat 546–547
FID *see* Flame ionization dectector
Field theory 183–184
Flame ionization dectector (FID), cold-start hydrocarbon emissions 563–593
Flame luminescence, GDI combustion 501
Flamelet models 362, 630–632
Flames
absolute concentration measurements 233–252
temperature measurements 236–237
FLASHCHAIN model 406
Flue gas desulfurization 313–314
dry processes 314–315
neutralization 318–319
spray absorption processes 314
washing processes 310, 314
Flue gases
CO_2 331–332
drag reduction 327
NO_x 319–322
sewage sludge combustion 76–77
SO_2 314–319, 332–334
SO_x 228–229
Fluid particle trajectories, Lagrangian approach 141–142
Fluidized bed combustors (FBC) 67–69, 72–74, 75, 89, 105–106
Fly ash
discrimination 37
particles 119–123
Ford 517, 543
Form anisotropy 27
Forward difference time domain (FDTD) technique 15

Fossil-fuel combustion technology 390
Four-stroke engines
  air-assisted fuel injectors 464–466
  fuel economy 512
Four-way coupling 144–146
Fractal agglomerates 24–27
Fraunhofer diffraction 4, 18–19, 31, 42
Free-energy devices 165–166
Fuel
  atomization 452–455
